Technical Skills

Programming

- Python
- Bash
- R

Big Data

- Kafka
- Spark

Orchestration

- Airflow
- ControlM

Containerisation

- Docker
- Kubernetes

Web Framework

- Flask
- Django

Microservices

- Distributed Systems
- RESTful APIs
- Event-Driven Architecture

Cloud Devops

- AWS
- Azure
- GithubActions
- Terraform

Databases

- PostgreSQL
- CosmosDB
- MongoDB
- Mysql

Education

PGDM

Globsyn Business School 2007 – 2009

BA in Economics(Hons), Mathematics & Statistics

North Bengal University. 2003 – 2006

Summary

A decade of experience in the domain of Data Engineering, Distributed systems, Databases, Microservices(API Gateway,Event-Driven & Containerisation) and Cloud architecture(AWS & Azure).

Industry-Specific Expertise

Retail

Tech Stack: Kafka, Azure, Databricks, Control-M

- Played a key role in a cloud modernization project, transitioning messaging systems from Azure Service Bus to Confluent Kafka for enhanced performance and real-time capabilities.
- Managed data orchestration schedules using Control-M, controlling data pipeline execution and job dependencies for mission-critical Databricks (PySpark) workloads.
- Contributed to infrastructure as code (IaC) development with Terraform, provisioning and managing Azure resources including Cosmos DB for database needs and Azure Key Vault for secrets management.
- Exposure in KEDA autoscaling for Kubernetes workloads, effectively scaling pods to zero during periods of inactivity and scaling out based on message queues, reducing infrastructure costs.
- Exposure with centralized monitoring strategy with Datadog, integrating logs, metrics, and traces from Databricks, Kafka, and Kubernetes to provide comprehensive observability.

Insurance

Tech Stack: Python, AWS Lambda, Jenkins

- Led data platform modernization, migrating legacy COBOL and SAS systems to Python-based pipelines using Databricks and Spark.
- Increased data pipeline robustness by implementing a CI/CD workflow with Jenkins

FinancialServices

Tech Stack: Python, AWS Lambda, Jenkins

- Architect an automated data processing framework that ingests JSON templates to dynamically apply Spark transformations on datasets.
- Generated structured JSON reports from transformed data, which directly fed predefined Tableau dashboards for business intelligence.
- Leveraged a modern tech stack, including Python, Spark, PostgreSQL, Git, AWS S3, and AWS Fargate, for a scalable and reliable solution.
- Implemented containerized deployment using Docker on AWS Fargate to ensure portability and automated scalability of the framework.

Healthcare

Tech Stack: Python, AWS Lambda, Jenkins

- Architect and developed a Python-based API using AWS Lambda to automate the clinical approval process for a Merck client, reducing manual overhead.
- Increased data pipeline robustness by implementing a CI/CD workflow with Jenkins
